

Alleato-Procore Overview

What it is

Alleato-Procore is the internal repository powering the Alleato Project Manager add-on for Procore, co

Who it is for

Alleato project operations and engineering teams building and validating AI-enhanced workflows inside

What it does

- Hosts a Next.js 15 App Router UI with domain components and Supabase queries.
- Runs a FastAPI backend that wires ChatKit streaming and `alleato_agent_workflow` into a Supabase-
- Manages Supabase migrations/seeds via the `supabase/` directory plus Drizzle scripts.
- Ships Playwright and Jest automation, screenshot reports, and QA scripts.
- Keeps `docs/`, `docs-ai/`, and `PRPs/` aligned with Procore workflows.
- Provides scripts for database seeding, crawls, and regression automation.

How it works

- The Next.js frontend calls FastAPI endpoints (including `/chatkit`) with CORS so the UI can reach AI-a
- FastAPI loads env vars, mounts SupabaseRagStore, and runs RagChatKit streaming servers tied to
- Supabase holds schema, RLS policies, and data; Drizzle plus SQL migrations keep it synchronized v
- Playwright (frontend and repo tests) plus Jest/Allure guard UI behavior while scripts/ orchestrate see
- `docs/`, `docs-ai/`, `PRPs/`, and `screenshots/` document every workflow and verification artifact for contrib

How to run

- Install Node.js 18+, npm (pnpm supported), Python 3.11+, Supabase creds, and an OpenAI API key
- Run `npm run install:all` from the repo root to install root and frontend dependencies.
- Copy templates: `cp frontend/.env.example frontend/.env.local` and `cp backend/.env.template backend/.env.local`
- Start both services with `npm run dev` (or run `npm run dev:frontend` and `npm run dev:backend` separa
